

Fetch, Axios & Web Services

1

Which one?

Axios (npm library)

Fetch (browser built-in)

node-fetch (npm lib)

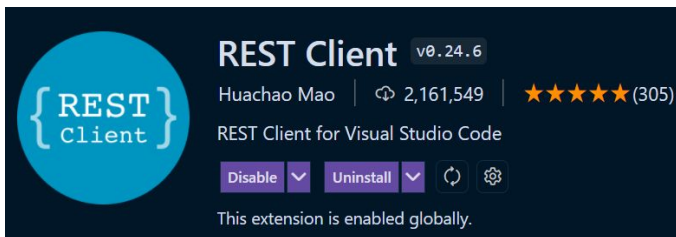

2

Topics

- Browser fetch() function
- NodeJS axios library
- Sending HTTP GET Requests
- Handling HTTP Responses
- Sending HTTP POST Request

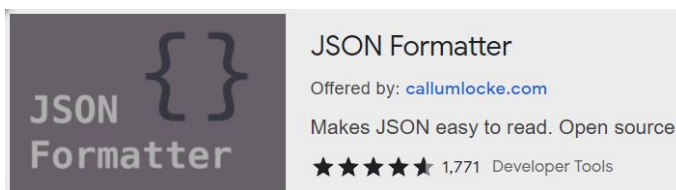

3

Recommended Tools/Extensions

REST Client v0.24.6
Huachao Mao | 2,161,549 | ★★★★★ (305)
REST Client for Visual Studio Code
Disable | Uninstall | Refresh | Settings
This extension is enabled globally.

VSCode Extension

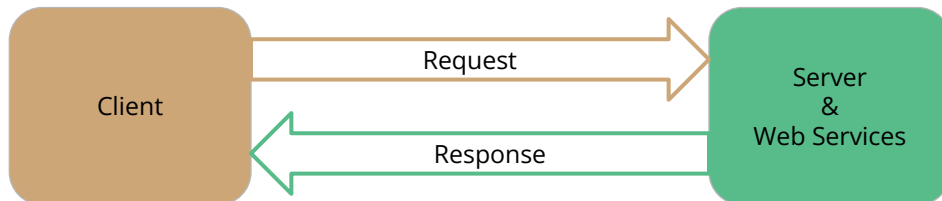

JSON Formatter
Offered by: callumlocke.com
Makes JSON easy to read. Open source.
★★★★★ 1,771 Developer Tools

Browser Extension

4

HTTP Request & Response

HyperText: payload in response can be contents in **any** format (CSS, HTML, JPG, JS, JSON, PDF, PNG, ZIP,)

5

Basic Use

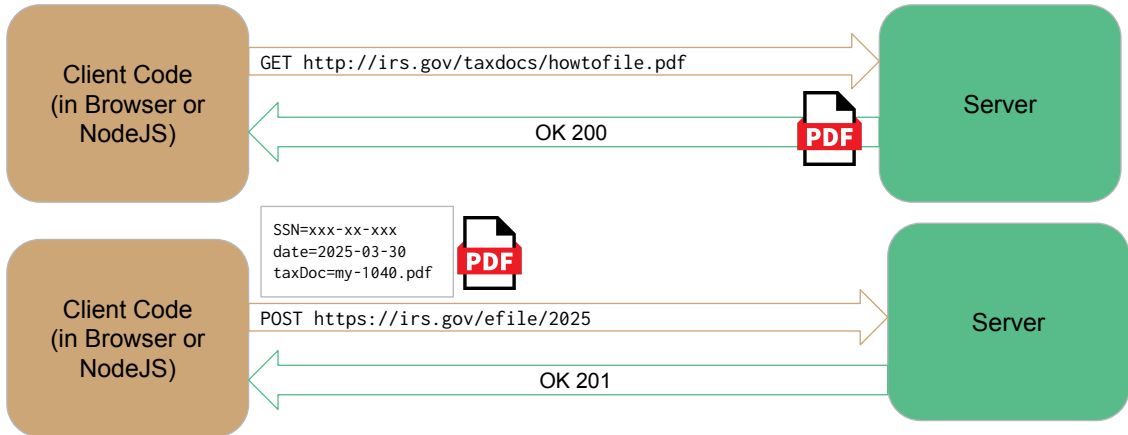

```
fetch("http://some.website.org")
  .then((r:Response) => {
    //
    // Process the response
    // from the server here
    //
  })
  .catch((e:any) => {
    //
    // Handle potential
    // errors here
    //
  });
```

```
import axios, {AxiosResponse} from "axios";

axios.get("http://some.website.org")
  .then((r:AxiosResponse) => {
    //
    // Process the response
    // from the server here
    //
  })
  .catch((e:any) => {
    // Handle potential
    // errors here
  });
```

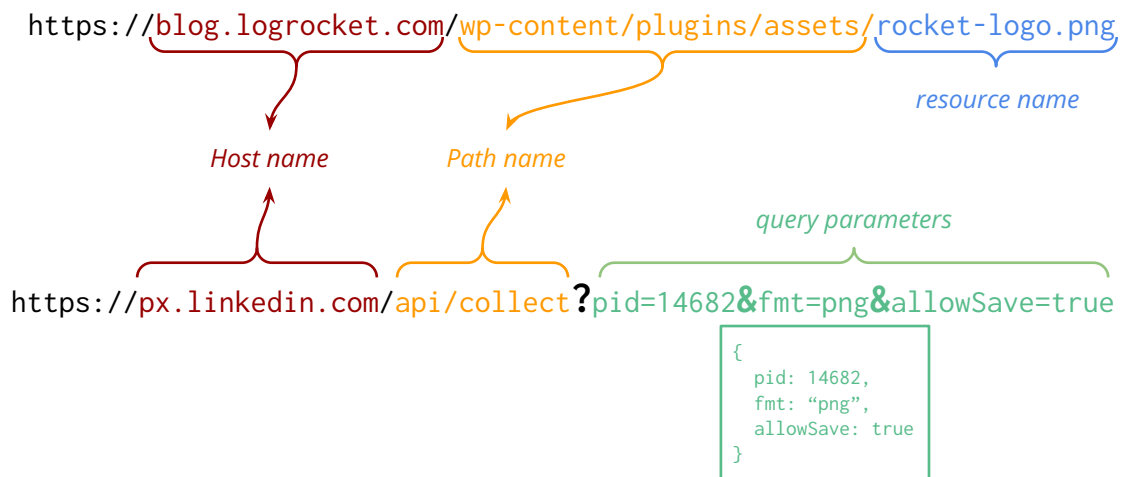

6

HTTP Methods: GET versus POST

7

URL components

8

Part A: Sending HTTP GET Requests

9

Using axios

```
# In a new folder/directory
npm init -y

npm install axios

# Add Axios type declaration file
npm install -D @types/axios

# Add other libs
npm install -D ts-node typescript

# Initialize tsconfig.json
npx tsc --init

npx ts-node my-first-axios.ts
```

```
// In my-first-axios.ts (Option #1)
import axios, {AxiosResponse} from "axios"
axios.get("http://info.cern.ch")
  .then((resp: AxiosResponse) => {
    console.log(resp.headers);
    return resp.data;
  })
  .then((whatsInIt: any) => {
    console.log(whatsInIt);
  });
```

```
// In my-first-axios.ts (Option #2)
import axios, {AxiosResponse} from "axios"
axios.get("http://info.cern.ch")
  .then((resp: AxiosResponse) => resp.data)
  .then((whatsInIt: any) => {
    console.log(whatsInIt);
  });
```

10

Live Demo

NodeJS & Web DevTools => Network

11

Example of Web Services

- Random Users
 - Documentation: <https://randomuser.me/documentation>
 - Service Endpoint <https://randomuser.me/api>
- Random Quotes
 - Documentation: <https://github.com/lukePeavey/quotable>
 - Service Endpoint: <https://api.quotables.io>
- A gazillion more Web Services: <https://github.com/public-apis/public-apis>
 - Pick ones that allow CORS

13

Example #1: Random User

Browser

<https://randomuser.me/api>

```
type RandUserData = {
  results: Array<RandomUser>;
  info: any
}
```

```
type RandomUser = {
  name: {
    title: string;
    first: string;
    last: string;
  },
  email: string
}
```

```
axios.request({
  method: "GET",
  url: "https://randomuser.me/api"
})
.then((resp:AxiosResponse) => rest.data)
.then((incoming: RandUserData) => {
  console.log(incoming.info);
  for (let k = 0; k < incoming.results.length; k++) {
    console.log(incoming.results[k]);
  }
});
```

14

VSCode Demo

15

Example #2: Random Quote

Browser <http://api.quotable.io/random>

```
type Quote = {
  tags: Array<string>;
  content: string;
  author: string;
  length: number
}
```

```
axios.request({
  method: "GET",
  url: "http://api.quotable.io/random"
})
.then((resp:AxiosResponse) => rest.data)
.then((q: Quote) => {
  console.log(`${q.content} [${q.author}]`)
});
```

16

Example #1: Random User with Query Params

Browser <https://randomuser.me/api?results=5&nat=gb,fr&inc=name,email,picture>

```
type RandUserData = {
  results: Array<RandomUser>;
  info: any
}

type RandomUser = {
  name: {
    title: string;
    first: string;
    last: string;
  },
  email: string
}
```

```
axios.request({ method: "GET",
  url: "https://randomuser.me/api",
  params: {
    results: 5,
    nat: "gb,fr",
    inc: "name,email,picture"
  }
})
.then((resp:AxiosResponse) => rest.data)
.then((incoming: RandUserData) => {
  console.log(incoming.info);
  for (let k = 0; k < incoming.results.length; k++) {
    console.log(incoming.results[k]);
  }
});
```

17

Example #3: Random Quotes with Query params

Browser `http://api.quotable.io/quotes?limit=3`

```
type QuoteResponse = {  
  count: number,  
  results: Array<Quote>  
}
```

```
type Quote = {  
  tags: Array<string>;  
  content: string;  
  author: string;  
  length: number  
}
```

```
axios.request({  
  method: "GET",  
  url: "http://api.quotable.io/quotes",  
  params: {  
    limit: 3  
  }  
})  
  .then((resp: AxiosResponse) => rest.data)  
  .then((qr: QuoteResponse) => {  
    console.log(qr.count)  
    for (let q of qr.results) {  
      console.log(q);  
    }  
  });
```

18

Part B: Sending HTTP POST requests ("Email" with attachments)

19

Example: HTTP POST Request + Data Payload

The screenshot shows the browser's developer tools with the 'Request' tab selected. The request URL is `https://aa.google.com/u/0/_/gog/get?rt=j&sourceid=538`. The status is `200 OK`. The request headers include `Content-Length: 69` and `Content-Type: application/x-www-form-urlencoded; charset=utf-8`. The request payload is shown in hex: `f.req=%5B%22og.botreq%22%2Cnull%22%22%2Cnull%2Ctrue%2C0%2Cfalse%5D`. A yellow box highlights the `Content-Type` header in the request headers and a corresponding code snippet for axios:

```
const options = {
  method: "POST",
  url: "https://aa.google.com/u/0/____",
  data: discussed-in-the-next-few-slides
  headers: {
    "Content-Type": discussed-in-the-next-few-slides
  }
}
axios.request(options)
  .then((r:Response) => { /* your code here */ });
```

20

HTTP Post Data Payload

- Request must include "Content-Type" header to inform server how to parse/unpack the data payload

Content-Type	Format of Data Payload	When to Use
application/x-www-form-urlencoded	Key-value pair, special characters are encoded using ASCII Hex	Multiple textual data items of <i>relatively small size</i>
multipart/form-data	Multiple "documents", delimited by special lines. Binary data are encoded to hex	Multiple text or binary data items of <i>larger size</i> (images, PDF, ...), each item becomes one attachment of your "email"
application/json	JSON (converted to text)	Structured textual data
text/plain	Any plain text	Unstructured textual data

21

HTTP POST: Plain Text attachment

```
const myMessage: string = "Hello World\n" +  
  "Do you copy?";  
  
axios.request({  
  method: "POST",  
  url: "https://pizza4.me/order"  
  headers: {  
    "Content-Type": "text/plain"  
  },  
  data: myMessage  
})  
.then((r:Response) => { /* code here */ });
```

Rarely used in practice

Actual HTTP Request

```
POST /order HTTP/1.1  
Host: https://pizza4.me  
Content-Type: text/plain  
Content-Length: 24  
  
Hello World  
Do you copy?
```

22

VSCoDe Demo

23

HTTP POST: JSON data attachment

```
const pizzaOrder = {
  size: 8,
  crust: "thin",
  toppings: ["cheese", "green pepper", "ham"],
  extraCheese: true
}

axios.request({
  method: "POST",
  url: "https://pizza4.me/order",
  headers: {
    "Content-Type": "application/json"
  },
  data: JSON.stringify(pizzaOrder)
})
.then((r:Response) => { /* code here */ });
```

- Use `JSON.stringify()` to convert a JS/TS object to its string representation
- The data is delivered as plain/text

Actual HTTP Request

```
POST /order HTTP/1.1
Host: https://pizza4.me
Content-Type: application/json
Content-Length: 89

{"size":8,"crust":"thin","toppings":
:["cheese","green pepper","ham"],
"extraCheese":true}
```

24

HTTP POST: application/x-www-form-urlencoded

```
const payload = new URLSearchParams();
payload.append("size", "8"); // must be a string
payload.append("crust", "thin");
payload.append("extraCheese", "true");
const toppings = ["cheese", "green pepper", "ham"];
for(let k = 0; k < toppings.length; k++) {
  formData.append("toppings[]", t);
  // formData.append(`toppings[${k}]`, t);
}

axios.request({
  method: "POST",
  url: "https://pizza4.me/order",
  headers: {
    "Content-Type": "application/x-www-form-urlencoded"
  },
  data: payload
})
.then((r:Response) => { /* code here */ });
```

Actual HTTP Request

```
POST /order HTTP/1.1
Host: https://pizza4.me
Content-Type: application/x-www-form-urlencoded
Content-Length: 93
```

```
size=8&crust=thin&extraCheese=true&toppings[]=ch
eese&toppings[]=green%20pepper&toppings[]=ham
```

Key name for arrays ends with `[]` (empty brackets)

25

HTTP POST: multipart/form-data

```
import * as FormData from "form-data";
const payload = new FormData();
payload.append("size", 8);
payload.append("crust", "thin");
toppings = ["cheese", "green pepper", "ham"]
toppings.forEach((t) => {
  payload.append("toppings[]", t);
});
```

```
axios.request({
  method: "POST",
  url: "https://pizza4.me/order",
  headers: payload.getHeaders(),
  data: payload
})
.then((r:Response) => { /* code here */ });
```

- Use this for sending multiple data which can be expressed as key-value pairs of significantly large size
- Each data item can be text or binary (a **Blob** object in the Web API doc)
- The HTTP protocol enforces a limit on the maximum message size. A huge payload must be split into smaller chunks

26

```
POST /order HTTP/1.1
Host: https://pizza4.me
Content-Type: multipart/form-data; boundary=letseatpizza
Content-Length: xxxx
```

```
--letseatpizza
Content-Disposition: form-data; name="size"
Content-type: text/plain
```

```
8
--letseatpizza
Content-Disposition: form-data; name="toppings[]"
```

```
cheese
--letseatpizza
Content-Disposition: form-data; name="toppings[]"
```

```
green pepper
--letseatpizza
Content-Disposition: form-data; name="extraCheese"
```

```
true
--letseatpizza--
```

Actual HTTP Request

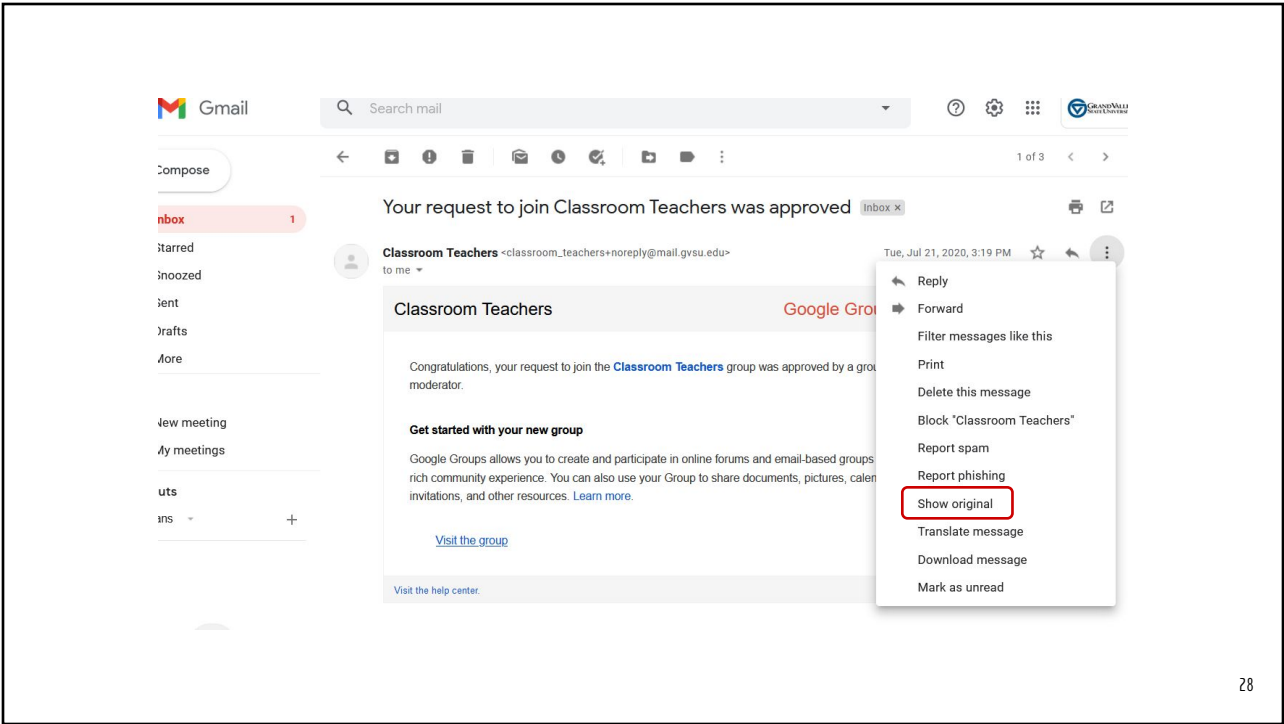

- The boundary text ("letseatpizza" in example) will be auto generated by the utility you use
- Each part may include more headers.
- Parts with binary data will include Content-Type header with proper value (such as "image/jpeg") to inform the server how to unpack each part

Try this

For a real example of a multipart message, open a message that has attachments in Gmail and select "Show Original"

27

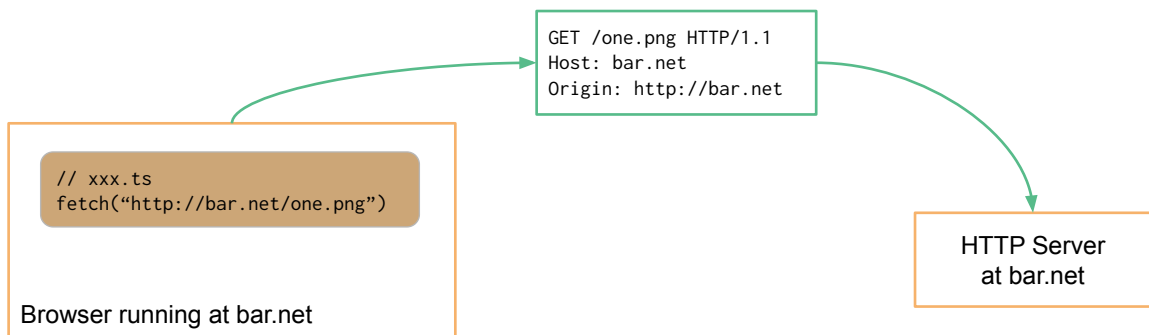

Browser Same-Origin Policy

- Scripts loaded from <http://some.domain.net> are allowed to fetch resources from <http://some.domain.net>
- Scripts loaded from <http://some.domain.net> are NOT automatically allowed to fetch from (cross-origin)
 - <https://some.domain.net> (different protocol)
 - <http://some.domain.org> (different domain)
 - <http://some.other-name.net> (different domain)
 - <http://some.domain.net:9000> (different port)
- Cross-origin requests require *special handling by the server!*

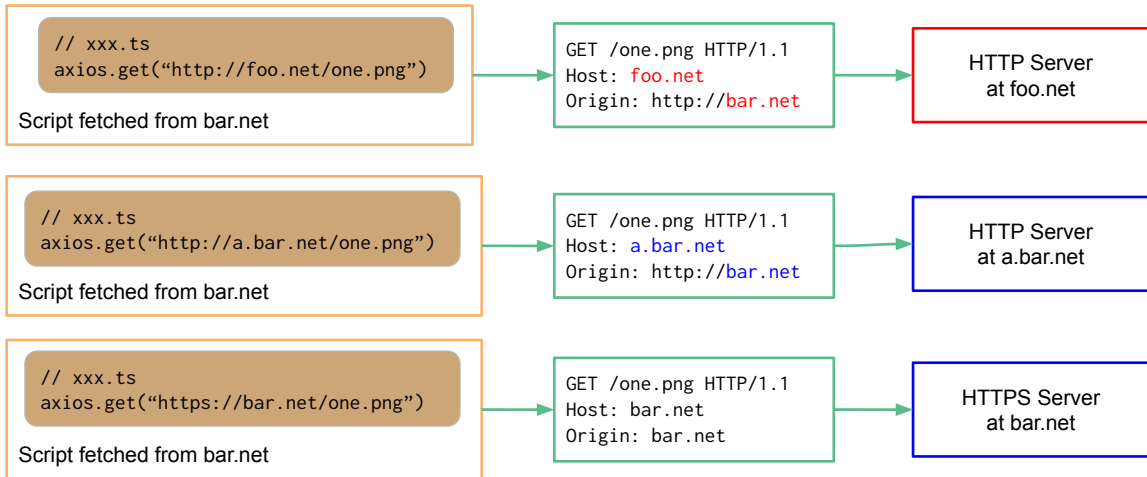

30

Same Origin

31

Different Origin (Cross Origin)

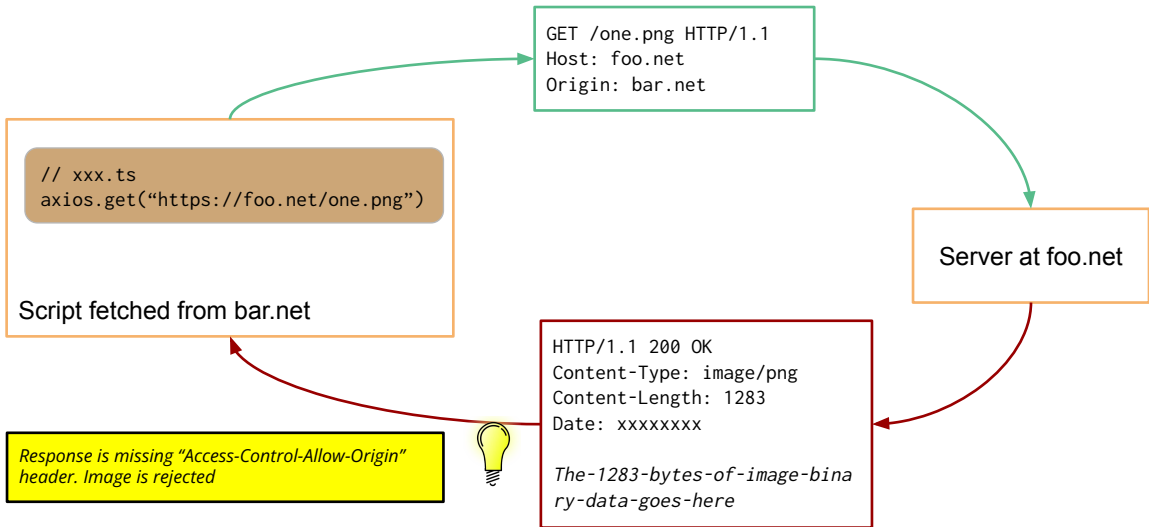

32

CORS (Cross-Origin Resource Sharing)

- New(er) spec to allow **browsers** “break” the **same-origin** policy
- Typical Client/Server negotiation sequence:
 - Client: send an HTTP OPTION query that include the following header lines
 - “Origin” and “Access-Control-Request-Method”
 - Server: responds with the following header lines
 - Access-Control-Allow-Origin
 - Access-Control-Allow-Methods

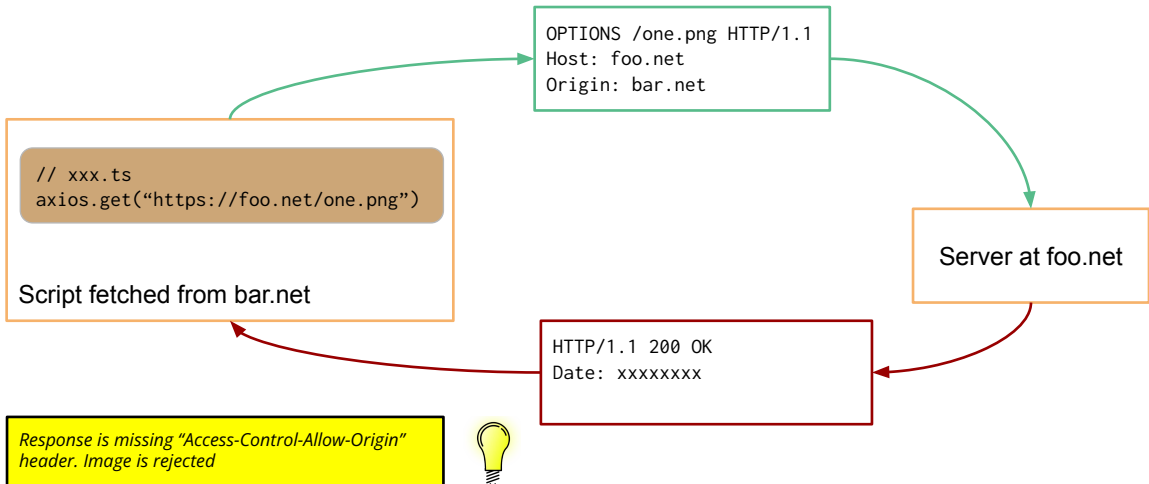

33

CORS: Rejected Response (Simplified)

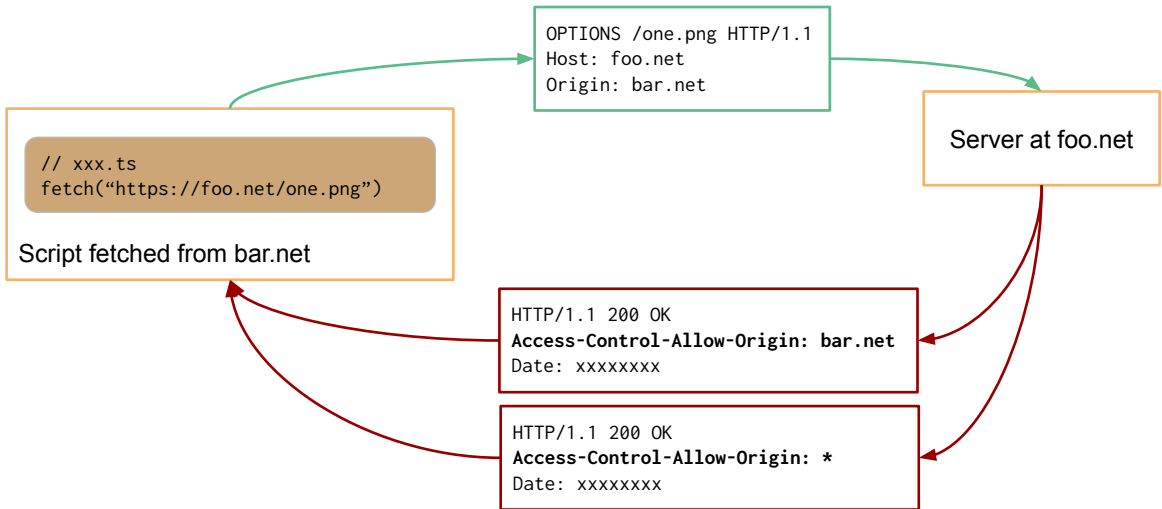

34

CORS: Rejected Response (Actual Message Types)

35

CORS: Accepted Response

36

WebDevTools Network: CORS

37

38

Solving CORS issue

1. Change the server settings to enable CORS (*only possible if you are the admin of that server*)
2. Access the service via a middleware
 - a. Your script (in the browser) sends the request to a middleware (running on the same host where keep the script)
 - b. The middleware then sends the actual request to the actual server

This strategy tricks the Browser as if the responses are coming from the middleware running on the same host

3. Using a third-party Proxy server (in place of your own middleware)

39
